

SLATWALL LIGHTING SYSTEM

Abstract

An attachment device that allows a user to quickly and easily assemble a lighting system on a slotted or grooved room surface such as a slatwall. The system provides an elongated member that provide both power and support to a plurality of lighting fixtures, which may attached to slots or grooves on a room surface. The lighting fixtures are removably attachable to the elongated member and do not require independent wiring or power sources. The lighting fixtures themselves are able to slide along the elongated member while under power and allow rotation for positioning the direction of their illumination.
